                                                                                                                                                                                                                                                                                             δÃ
                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an activation-induced cytidine deaminase CC (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and CC has cytidine activity similar to APOBEC-1. AID has antiallergic, CC antianaemic, antiasthmatic, ophthalmological, anti-HIV and CC dermatological activities, and can be used in gene therapy. AID CC polynucleotides are useful in methods for identifying drugs for the CC treatment of B cell associated immune system disorders, immunodeficiency CC diseases and allergies, such as immunoglobulin A (IgA) deficiency CC disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, Rosen CC colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen CC disease, DiGeorge disease, ataxia telengiectasia, common variable immunodeficiency disease, ataxia telengiectasia, common variable CC indunodeficiency disease, ataxia telengiectasia, common variable CC in discorder, and IgG subclass selection disorder. The DNA sequences CC in discorder, and IgG subclass selection disorder. The DNA sequences CC encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders. The DNA sequences are present sequence represents the exon 3 genomic DNA sequence of human AID.
                                                                                                                                                                                                                                                                                                                                  Query Match

The present invention describes an activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antianaemic, antiasthmatic, ophthalmological, anti-HIV and Cd dermatological activities, and can be used in gene therapy. AID CD polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (JgA) deficiency Cd diseases, IgA nephritis, gamma-globulinaemia, atopic dermatitis, Rosen Cd disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disease, ataxia telangiectasia, common variable immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgC discriber, and IgG subclass selection disorder. The DNA sequences cencoding AID may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders. The DNA sequence of human AID.
                                                                                                                                                                                                                              Query Match

                                                                            δÃ
                                                                                                                                                                                                       The present invention describes an activation-induced cytidine deaminase (C (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and C has cytidine activity similar to APOBEC-1. AID has antiallergic, C antianaemic, antiasthmatic, ophthalmological, anti-HIV and C dermatological activities, and can be used in gene therapy. AID C polypuclootides are useful in methods for identifying drugs for the C treatment of B cell associated immune system disorders, immunodeficiency C diseases and allergies, such as immunoglobulin A (IgA) deficiency C diseases, IgA nephritis, gamma-globulinaemia, atopic dermatitis, Rosen C disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, Rosen C colltis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen C immunodeficiency disease, ataxia telangiectasia, common variable C immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated C IgE disorder, and IgG subclass selection disorder. The DNA sequences C encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         immune related disease; allergy; allergic disease; antiallergic; antianaemic; antiasthmatic; ophthalmological; anti-HIV; dermatological; gene therapy; B cell associated immune system disorder; food allergy; immunodeficiency disease; immunoglobulin A deficiency disease; asthma; 19A nephritis; gamma-globulinaemia; atopic dermatitis; allergic colitis; drug allergy; allergic rhinitis; Rosen disease; Dideorge disease; AIDS; ataxia telangiectasia; common variable immunodeficiency disorder; major histocompatibility class II deficiency disease; major histocompatibility class II deficiency disease;
                                  disease, IgA nephritis, gamma-globulināemia, atopic dermatitis, allergi colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, DiGeorge disease, ataxia telangiectasia, common variable immunodeficiency disorder, MHC (major histocompatibility class) class II deficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AII protein may be used for diagnosis and treatment of these disorders. The present sequence represents a genomic DNA sequence of human AID.
                                                                                                                                                                                                                                                The present invention describes an activation-induced cytidine deaminase (AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and has cytidine activity similar to APOBEC-1. AID has antiallergic, antianaemic, antiasthmatic, ophthalmological, anti-HIV and dermatological activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the polynucleotides are useful in methods for identifying drugs for the
                                                                                                                                                                                                         treatment of B cell associated immune system disorders, immunodefi diseases and allergies, such as immunoglobulin A (IgA) deficiency,
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding activation induced cytidine deaminase, useful a target for drug development for immune-related diseases including

                                                                                                             ρ
                                                                                                                                                                                                 AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and ctreatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to cupplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the CC protein. (I) proteins and polynucleotides may be used to prevent. CC diagnose and treat immune/haematopoietic-related diseases, especially concers and cancer metastases of haematopoietic-derived cells. AAK64703 CC cancers and cancer metastases of haematopoietic antigen genomic concerns and cancer metastases of haematopoietic concerns the present invention. AAK54920 and AAK84950 and AA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, uses for detecting presence of prostate cancer, stage of prostate cancer
                                                                                                                                                                                                                                                                          Sequence 481

(I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate cell carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 1
US-09-798-096-10/c
                                                                                                                                                                                                                                                                                                                                                                                                                                    US-09-797-906-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-09-798-096-10
                                                                                                                                                                                                                                                     Sequence 3, Application US/09797906
Patent No. 6329188
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Zianghe YAN, Karen A. KETCHUM, Valentina DIFRANCESCO, Ellen M. BEASLEY
TITLE OF INVENTION: ISOLATED HUMAN PROTEASE PROTEINS,
TITLE OF INVENTION: NUCLEIC ACID MOLECULES ENCODING HUMAN PROTEASE PROTEINS, AND
TITLE OF INVENTION: USES THEREOF
FILE REFERENCE: CL001151CIP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         dermatological activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic colitis, asthma, food allergy drug allergy, allergic rhinitis, Rosen disease, Digeorge disease, ataxia telangiectasia, common variable immunodeficiency disorder, MHC (major histocompatibility class) class II deficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 140-141; 174pp; Japanese

(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and that cytidine activity similar to APOBEC-1. AID has antiallergic, antianaemic, antiasthmatic, ophthalmological, anti-HIV and dermatological activities, and can be used in gene therapy. AID dermatological activities, and can be used in gene therapy. AID polynucleotides are useful in methods for identifying drugs for the treatment of B cell associated immune system disorders, immunodeficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency diseases and allergies, such as immunoglobulin A (IgA) deficiency colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen disease, Difeorge disease, MHC (major histocompatibility class) class immunodeficiency disease, AIDS (auto immunodeficiency syndrome), elevated IgE disorder, and IgG subclass selection disorder. The DNA sequences encoding AID may be used for gene therapy and the antibodies to the AID protein may be used for diagnosis and treatment of these disorders.

sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogeni polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by placenes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. Placenes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of Placenes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for Placenes proteins. These antibodies can be used to

26-MAY-2000;
30-JUN-2000;
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Penn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      downregulate expression and activity of P. acnes polypeptides therefore treat P. acnes infections. The antibodies may also be diagnostic agents for determining P. acnes presence, for example 1.1kked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of t specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                useful

Note: The sequence data for this patent did not form printed specification, but was obtained in electronic from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                   The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single excountly make the five fitter that the invention.

                                                                                                                                                       measuring human gene expression in a sample derived from human heart (se ABA21535-ABA41305). The present sequence is a protein encoded by one suc probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease.
                                                                                                                        hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The present sequence is a protein er
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples which may enable the diagnosis and improved treatment of nervous system which may enable the diagnosis and improved treatment of nervous system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                 (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome-derived single exon nucleic acid probes useful analyzing gene expression in human cervical epithelial cells
                                                                                                                              Sequence
                                                                                                                                                                                          Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic contivity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and ctreatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome cc that affect the activity of (I) by expressing inactive proteins or to complement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, CC diagnose and treat immune/haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703 CC sequences from the present invention. AAK54942 to AAK54950 and AAM82169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-NOV-2000

                                                                                                                                                                                                              A ARS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) camino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) creatment of diseases associated with inappropriate (I) expression for cexample, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to cyplement the patients own production of (I). Additionally, (I) cpolynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the colarins of the nucleins and polynucleotides may be used to provent, cancers and cancer metastases of haematopoietic derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic concerns according to the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                         밁

                                                                                                                                                                                                                                                                                                                                                                                                                  The Actinomadura hibisca polyketide synthase proteins AAW54380-W84390 form a multienzyme complex. The enzyme is used for the biosynthesis of a dihydrobenzo(a)naphthacenequinone aglycon preferably a pradimicin which is an antibiotic useful against systemic fungal infections caused by Candida albicans, Aspergillus fumigatus and Cryptococcus neoformans. It is also active against a wide variety of fungi and yeasts, some Gram-positive bacteria and viruses.
                                                                                                                                   Human; vaccination; gene therapy; nutritional supplement;
stem cell proliferation; haematopoiesis; nerve tissue regeneration;
immune suppression; immune stimulation; anti-inflammatory; leukaemia.
